Split Hopkinson pressure bar test results for the rate dependence of SC-15, a thermoset polymer matrix material, were used as a guide for an initial guess of the rate-dependent properties. SC-15 epoxy is a low-viscosity, two-phased toughened epoxy resin system consisting of phase A (resin mixture of diglycidylether epoxy toughener) and phase B (hardener mixture of cycloaliphaic amine poluoxylalkylamine) 13 . The assumed rate dependence for SC-15 is plotted as a solid line in gure 8, where the circles represent the experimental data. Due to the complexity of the constitutive model many parameters need to be determined; these are, modulus, yield stress ratio, power law expo-nent, and material damping. The known inputs can be seen in table 2. In a brittle epoxy sample, a test that subjects the panel to failure provides very little information about the yield and plasticity parameters. From such a test, about all that can be determined are the initial modulus and failure strength. Therefore, if a panel test is conducted at a suitable burst pres-sure below the plate to fracture level, the resulting oscillatory out-of-plane panel response provides information that can be used to determine several of the material parameters. Through the use of inverse modeling the following parameters for the NASA TM - 2010-216941 11 This item ships from La Vergne,TN. Paperback.
